1. Grade Checker

Grade-checker.py

Grade-checker.py > ...

```python
marks = int(input("Please enter your score"))

if marks>=90 : print("Grade = A")
elif marks >=80 and marks <=89 : print("Grade=B")
elif marks >=70 and marks <=79 : print("Grade=C")
elif marks >=60 and marks <=69 : print("Grade=D")
elif marks <60 : print("Grade=F")
```

PROBLEMS OUTPUT TERMINAL PORTS DEBUG CONSOLE

```
PS E:\assignment 2 tutedude> python .\Grade-checker.py
Please enter your score 89
Grade=B
PS E:\assignment 2 tutedude> python .\Grade-checker.py
Please enter your score 74
Grade=C
PS E:\assignment 2 tutedude>
```

Took user input then checked using nested if else statements.

2 Student Grades

Student-grade.py

Student-grade.py > ...

```python
students = {}

while True:
    print("\n1. Add Student")
    print("2. Update Grade")
    print("3. Print All Students")
    print("4. Exit")

    choice = input("Enter choice: ")

    if choice == "1":
        name = input("Enter student name: ")
        grade = input("Enter grade: ")
        students[name] = grade

    elif choice == "2":
        name = input("Enter student name to update: ")
        if name in students:
            grade = input("Enter new grade: ")
            students[name] = grade
        else:
            print("Student not found")

    elif choice == "3":
        print("\nStudent Grades:")
        for name, grade in students.items():
            print(name, ":", grade)

    elif choice == "4":
        break
```

Terminal

```
PROBLEMS    OUTPUT    TERMINAL    PORTS    DEBUG CONSOLE

PS E:\assignment 2 tutedude> python .\Student-grade.py

1. Add Student
2. Update Grade
3. Print All Students
4. Exit
Enter choice: 1
Enter student name: tutedude
Enter grade: A

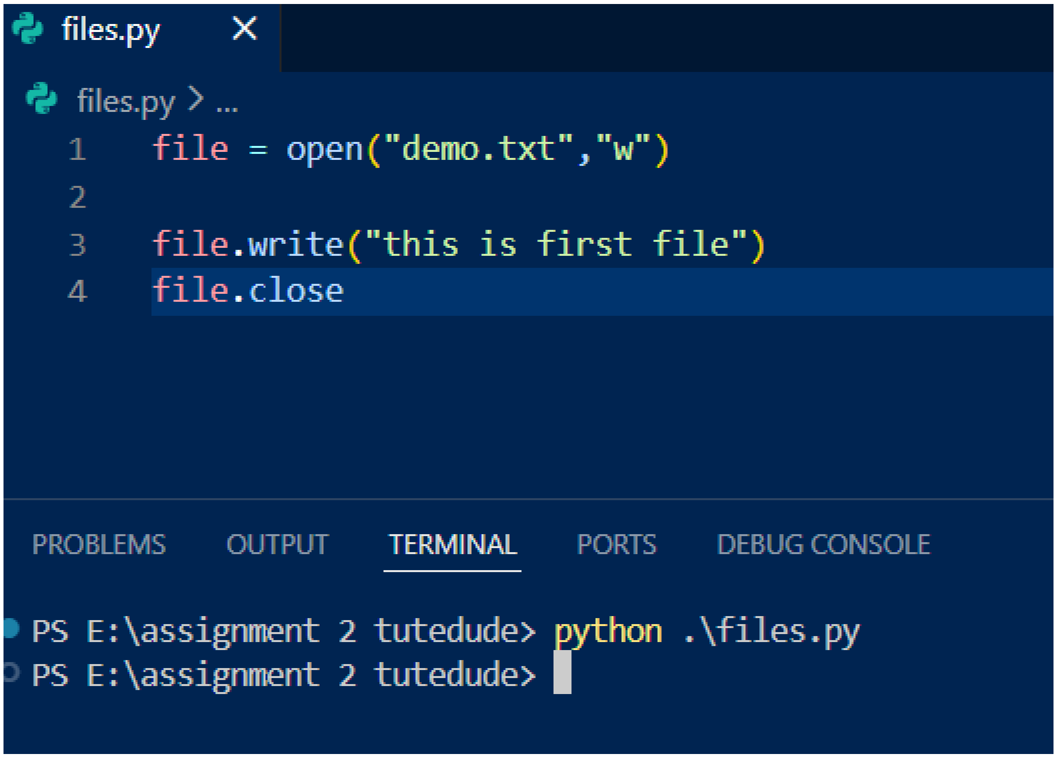
1. Add Student
2. Update Grade
3. Print All Students
4. Exit
Enter choice: 2
Enter student name to update: tutedude
Enter new grade: B

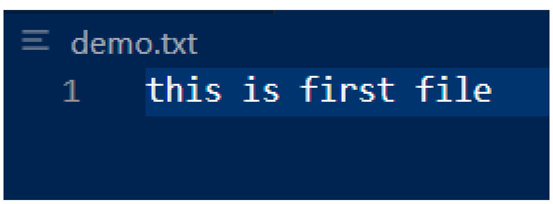
1. Add Student
2. Update Grade
3. Print All Students
4. Exit
Enter choice: 3

Student Grades:
tutedude : B
```

Used dictionary to store , taken input from user the name and grade the mapped it according as in dictionary student name = grades and stores . For updating first asked for the student name if present then update grade else student not present . In beginning make a while loop which is also true for which made a last option using break which means it will come out of the loop .Here the keys are student name which are aligned with the respective value given by the user.

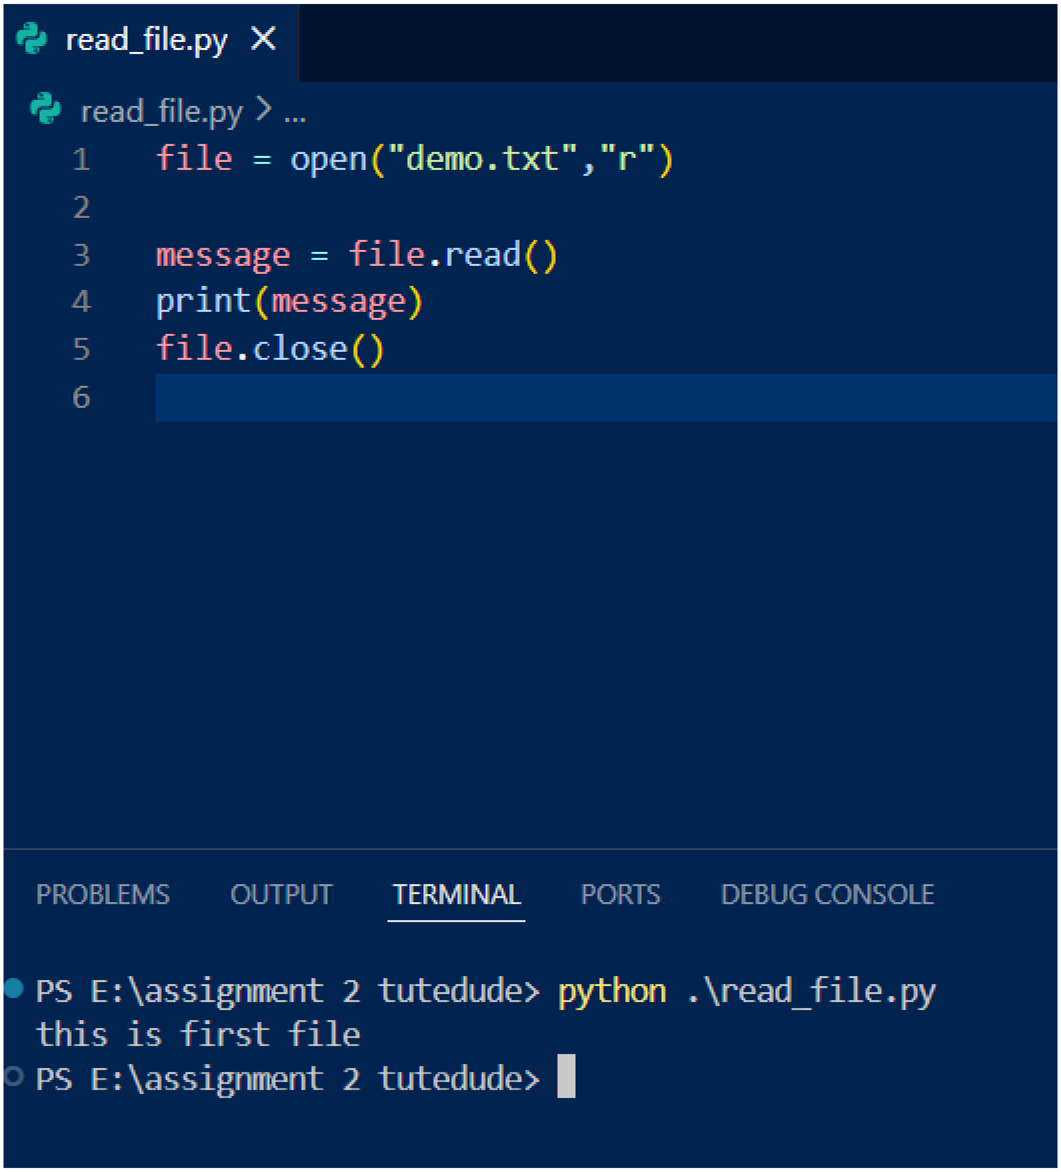
3.Write to a File





I wrote the python code when i ran it a file named “demo.txt” was created showing the text .

4. Read from a File



Read the file and stored in variable message then printed and closed the file .
